Summary

Lead Software Engineer with 7+ years shipping secure, production-grade full-stack and AI systems on AWS with hardened CI/CD pipelines. Built agentic AI and RAG solutions using LangChain and LangGraph, cutting manual workflows by 40% while mentoring engineers and leading cross-functional evaluations with vendors and internal teams. Known for reviewing code rigorously, automating remediation, and driving adoption of ML-backed tooling across communities of practice.

Skills

Python	GoLang	SDLC	Agile	Cloud Native
Automation	System Design	App Development	Testing	Security
Mobile	Financial Services	HTML	AWS cloud tools	AI / ML concepts
CI/CD	AI-Powered UI	JavaScript (ES6+)	CSS	Next.js
ReactJs	Redux	TypeScript	WebRTC	D3.js
HiCharts	DataWrapper	Playwright	NodeJs	REST APIs
SQL, PostgreSQL	Web Vitals (LCP, FID, CLS)	RTL, Jest, Enzyme	Figma	Git
Docker	Cloudflare	New Relic	GTM (Google Tag Manager)	Prompt Engineering
Github Copilot, CodeScene	Agentic Workflows			

Professional Experience

Sr. Software Engineer & Team Lead | Kodo Technologies

Bangalore (Aug 2022 - Present)

- Raised test coverage from 15% to 80% and reduced production bug rate by 60% by establishing code review standards and CI/CD pipelines across a team of 5 engineers.
- Architected procure-to-pay platform with role-based approval workflows (Form.IO), covering PO creation, vendor selection, invoice generation, and payment via credit cards and virtual accounts; delivered in 6 months against a 12-month estimate.
- Led corporate credit card onboarding platform that evaluated creditworthiness using financial data and director scores; replaced spreadsheet ops and cut onboarding time by 50%.
- Designed and deployed a production-grade agentic AI reporting assistant using LangChain and LangGraph; agent uses RAG pipelines over company invoices, reimbursements, and transaction records with vector search to answer financial queries via natural language chat, eliminating manual report generation.
- Built multi-agent orchestration workflows with tool-use and memory for complex multi-step financial reasoning; applied prompt engineering techniques to improve response accuracy and reduce hallucinations in enterprise financial context.

Sr. Frontend Developer & Team Lead | Artivatic Data Labs

Bangalore (Mar 2021 - Aug 2022)

- Worked with Python-based ML APIs to surface model outputs in Angular UIs; participated in model evaluation cycles and fine-tuning feedback loops; delivered enterprise-grade platform for Wipro serving 500+ users.
- Collaborated with ML engineers to fine-tune and productionize an AI underwriting engine (AUSIS) that scored insurance applications using multi-modal inputs — medical records, financial history, location-based fraud signals, and wearable health data; built Angular UI surfacing model risk scores and recommendations, cutting processing time by 40% per application.
- Led 3 engineers to build shared component library across all AI product UIs; accelerated feature delivery by 35%.
- Integrated computer-vision AI model for vehicle damage assessment; model analyzed uploaded claim videos, detected damaged parts, and predicted repair and replacement costs including labor; enabled faster claims estimates and fraud detection for duplicate or inflated claims.

- Contributed to production insurance fraud detection model integrating behavioral signals, claim patterns, and historical data; built real-time review dashboard visualizing model outputs, fraud scores, and detection reasoning for claims teams.

Full Stack Developer | Swipebucks Softs Pvt. Ltd

Mohali, Punjab (Apr 2018 - Mar 2021)

- Cart abandonment hit 45% at checkout; integrated Stripe and Paytm with unified UX and error recovery flows; raised conversion by 25% and cut payment failures by 40%.
- EdTerra had 20% monthly churn; added blogs, quizzes, and geolocation content features; lifted engagement 40% and reduced churn to 12%.
- Site load times reached 3 seconds under traffic spikes; applied Redis caching, query tuning, and CDN; cut load time to under 1.5 seconds and tripled capacity.
- Delivered Houzzcart e-commerce platform in 4 months using Angular 12 and Node.js; launched on time with zero critical bugs.

Education

B. Tech. - ECE, NSUT East Campus (AIACTR), GGSIPU

Delhi (Aug 2014 - May 2018)

- Currently its NSUT East Campus, Delhi, formerly known as the Ambedkar Institute of Advanced Communication Technologies & Research (AIACTR)

Projects

AI Voice Lead Qualification Agent (MCP)

(Jan 2026 - Present)

Agentic AI system that autonomously calls sales leads via Sarvam AI text-to-voice, conducts dynamic qualification conversations, and scores leads by interest level — enabling sales teams to focus only on high-intent prospects

MCP LangGraph Sarvam AI Python WebSocket REST APIs LLMs

Built agentic voice calling pipeline using Sarvam AI text-to-voice; AI agent calls leads, listens to responses, and dynamically generates follow-up questions based on conversation context to assess purchase intent.

Implemented MCP-based orchestration to coordinate the calling agent, response analysis agent, and CRM update agent — each agent hands off structured context to the next without human intervention.

Designed lead scoring model that classifies leads as hot, warm, or cold based on conversation transcript analysis using LLMs; reduced manual follow-up effort by filtering out uninterested leads before reaching the sales team.

AI Grocery Orchestration (MCP)

(Oct 2025 - Present)

Multi-agent grocery ordering system using Model Context Protocol; user sets dietary preferences in ChatGPT/Claude, AI generates a personalized meal plan, then autonomously orders required ingredients from nearby stores based on location

MCP LangChain LangGraph OpenAI API Claude API Python REST APIs

Designed multi-agent pipeline where a diet-planning agent generates weekly meal plans from user health preferences, then a procurement agent breaks meals into ingredient lists and places orders via grocery store APIs.

Implemented Model Context Protocol (MCP) to enable seamless context handoff between ChatGPT and Claude agents across planning and ordering steps without losing user preference state.

Integrated location-aware store selection and real-time inventory checks to route orders to the nearest available store, reducing fulfillment gaps.

Unusual Flow

(Nov 2024 - Mar 2025)

Real-time options trading scanner with WebSocket integration for live market data streaming

React TypeScript WebSocket

Traders needed faster access to unusual options activity; built real-time analytics dashboard with WebSocket streaming; reduced decision-making time by 35%.

Users requested customizable views for different trading strategies; implemented advanced filtering with saveable presets; increased daily active user engagement by 45%.

Market data was hard to visualize at scale; designed responsive S&P 500 heatmap with sector-based rendering; improved data comprehension based on user feedback.
